

Système : pt G de masse M

Référentiel : terrestre (galiléen)

base cartésienne (Ox) horizontale

Bilan des forces :

- Poids du canon : $\vec{P} = -Mg\vec{u}_y$
- Force de rappel du ressort : $\vec{F} = -k_x(l - L_0)\vec{u}_{\text{sortant}} = -k_x\vec{u}_x$
- Réaction du sol : $R_N = R_N\vec{u}_y$

1) PFS : $\vec{0} = \vec{P} + \vec{F} + R_N$

Projection sur $\vec{u}_x$: $-k(l - L_0) = 0$
 $(\Rightarrow) L_0 = l$

2) PFD : $\vec{P} + \vec{F} + R_N = m\vec{a}$

• cinématique : $\vec{OG} = x\vec{u}_x$ $\vec{v} = \dot{x}\vec{u}_x$ $\vec{a} = \ddot{x}\vec{u}_x$

Projection du PFD :

• selon $\vec{u}_x$: $m\ddot{x} = -k_x(x - L_0)$

$(\Rightarrow) \ddot{x} + \underbrace{\frac{k_x}{m}}_{\omega_0^2} x = \frac{k_x L_0}{m}$

avec $\omega_0 = \sqrt{\frac{k_x}{m}}$

Résolution :

a. sol essm : $A \cos(\omega_0 t) + B \sin(\omega_0 t)$

b. sol part : $x = \text{cste} \Rightarrow x(t) = L_0$

$$X = \frac{mv_0}{H\omega_0} < d$$

c. sol complète: $A \cos(\omega_0 t) + B \sin(\omega_0 t) + L_0$

d. conditions initiales:

$$x(0) = L_0$$

$$\Leftrightarrow A \cos(\omega_0 t) + L_0 = L_0$$

$$\Leftrightarrow A \cos(\omega_0 t) = 0 \Rightarrow A = 0$$

$$\dot{x}(0) = -\frac{m}{H} v_0$$

$$\Leftrightarrow B \omega_0 \cos(\omega_0 t) = -\frac{m}{H} v_0$$

$$\Leftrightarrow B \omega_0 = -\frac{m}{H} v_0 \Rightarrow B = -\frac{m}{H\omega_0} v_0$$

e. sol finale: $-\frac{m}{H\omega_0} v_0 \sin(\omega_0 t) + L_0 = x(t)$

3) mvt rectiligne ~~uniforme~~ sinusoïdal autour de L_0 (oscillateur harmonique).

4) Le recul maximum est noté d. ($\Leftrightarrow$ Amplitude).

$$\Rightarrow d = \frac{mv_0}{H\omega_0}$$

$$\Rightarrow \omega_0 = \frac{mv_0}{Hd}$$

$$\Rightarrow \omega_0^2 = \left(\frac{mv_0}{Hd} \right)^2$$

$$\Rightarrow \frac{k_1}{H} = \left(\frac{mv_0}{Hd} \right)^2$$

$$\Rightarrow k_1 = \left(\frac{mv_0}{d} \right)^2$$

$$\begin{aligned} \text{A.N: } k_1 &= 1800 \text{ N.m}^{-1} \\ &= 1,8 \times 10^3 \text{ N.m}^{-1} \end{aligned}$$

Inconvénients: le canon va constamment oscillé.

$$5) [-\lambda v] = [F]$$

$$[F] = M \cdot L \cdot T^{-2}$$

$$[v] = L \cdot T^{-1}$$

$$(z) [\lambda] = \frac{M \cdot L \cdot T^{-2}}{L \cdot T^{-1}} = M \cdot T^{-1} = kg \cdot s^{-1}$$

6) Bilan des forces:

$$\cdot \vec{P}$$

$$\cdot \vec{F}_2 = -k_2 (l - L_0) \vec{u}_x$$

$$\cdot \vec{R}_N$$

$$\cdot \text{Frottements visqueux: } \vec{F}_f = -\lambda \vec{v} = -\lambda \dot{x} \vec{u}_x$$

PFD:

$$\vec{P} + \vec{F}_2 + \vec{R}_N + \vec{F}_f = M \cdot \vec{a}$$

Projection PFD selon $\vec{u}_x$:

$$-k_2 (x - L_0) - \lambda \dot{x} = \ddot{x} M$$

$$(z) \ddot{x} M + \lambda \dot{x} = -k_2 (x - L_0)$$

$$(z) \ddot{x} + \frac{\lambda}{M} \dot{x} + \frac{k_2}{M} (x - L_0) = 0$$

$$(z) \ddot{x} + \frac{\lambda}{M} \dot{x} + \frac{k_2}{M} x = \frac{k_2}{M} L_0$$

$$\text{avec } \omega_2 = \sqrt{\frac{k_2}{M}}$$

Forme normalisée:

$$\ddot{x} + 2\xi \omega_2 \dot{x} + \omega_2^2 x = \omega_2^2 L_0$$

$$\text{avec } \xi = \frac{\lambda}{2\sqrt{Mk_2}} \text{ (par id.)}$$

$$7) \Delta = \left(\frac{\lambda^2}{M^2} \right) - 4(\omega_2^2)$$

Régime critique: $\Delta = 0$.

$$(z) \frac{\lambda^2}{M^2} - 4\omega_2^2 = 0$$

$$(z) \lambda = \sqrt{M^2 (4\omega_2^2)}$$

$$(z) \lambda = M \cdot 2\omega_2$$

$$\text{Or } \omega_2 = \sqrt{\frac{k_2}{M}}$$

$$(z) \lambda = 2\sqrt{k_2 M}$$

$$\text{A.N. } \lambda = 8,8 \times 10^2 \text{ kg} \cdot \text{s}^{-1}$$

$$\Delta' = \xi^2 - 1 = 0$$

$$(z) \xi = 1$$

8) Equation caractéristique: $X^2 + 2\xi\omega_z X + \omega_z^2 = 0$

$$\Delta = 0$$

$$\frac{\lambda^2}{H^2} - 4\omega_z^2 = 0$$

racine double $\lambda = -\frac{\frac{\lambda}{H} + \frac{\lambda}{H}}{2} - \lambda\omega_z = -\omega_z$

$$x(t) = (At+B)e^{-\omega_z t}$$

a) sol essm: $x(t) = (At+B)e^{-\omega_z t}$

b) sol particulière: $x(t) = L_0$

c) sol complète: $x(t) = (At+B)e^{-\omega_z t} + L_0$

d) C. I:

A $t=0$, $x(0) = 0$

$$\Rightarrow (A \times 0 + B)e^{-\omega_z \cdot 0} = 0$$

$$\Rightarrow B = 0$$

On a donc $x(t) = At e^{-\omega_z t}$

$$\begin{aligned} \dot{x}(t) &= Ae^{-\omega_z t} + At(-\omega_z)e^{-\omega_z t} \\ &= A(1 - \omega_z t)e^{-\omega_z t} \end{aligned}$$

A $t=0$, $\dot{x}(0) = v_c = -\frac{m}{M}v_0$

$$\Rightarrow A e^0 = -\frac{mv_0}{M}$$

$$\Rightarrow A = -\frac{mv_0}{M}$$

On a donc $x(t) = -\frac{mv_0}{M} t e^{-\omega_z t} + L_0$

$$\dot{x}(t) = -\frac{mv_0}{M} (1 - \omega_z t) e^{-\omega_z t}$$

9) $\dot{x}(t_m) = 0$ recul maximal qd $\vec{v} = \vec{0}$

$$\Leftrightarrow \underbrace{-\frac{mv_0}{M}}_{\neq 0} \underbrace{(1 - \omega_z t_m)}_{\neq 0} \underbrace{e^{-\omega_z t_m}}_{\neq 0} = 0$$

$$\Rightarrow (1 - \omega_z t_m) = 0$$

$$\Rightarrow t_m = \frac{1}{\omega_z}$$

A.N: $t_m = 1,8 \text{ s}$

$$d' = L_0 - x(t_m)$$

$$= \cancel{L_0} + \frac{mv_0}{M} t_m e^{-\omega_2 t_m} - \cancel{L_0}$$

$$\text{Or } t_m = \frac{1}{\omega_2}$$

$$\text{Donc } \underline{d'} = \frac{mv_0}{M\omega_2} e^{-1}$$

$$= \underline{\frac{2mv_0}{\lambda} e^{-1}} \quad \text{avec } \lambda = 2\sqrt{Mk_2}$$
